

# 432 Eurasian Siskin

[Put your logo here](#)

Siskin. Adult. Male (12-I).

## EURASIAN SISKIN (*Spinus spinus*)

### IDENTIFICATION

11-12 cm. **Male** with green-yellowish upperparts, streaked dark; yellow underparts, with streaked flanks; yellow rump; crown and bib black. **Female** brownish, yellow-greenish rump; without black on crown and throat.

Siskin. Pattern of wing, tail and head: top male; bottom female.

### SIMILAR SPECIES

Among yellow and green **Finches**, **Greenfinch** is bigger (14-15 cm). **Citril Finch** and **Serin** without yellow patches on tail feathers.

### SEXING

**Male** with crown (and usually bib) black (in **autumn** with feathers tipped grey); breast and rump yellow unstreaked; outer tail feathers with extensive yellow bases tipped black; **Female** with green-greyish crown streaked dark; without black bib; breast and rump yellowish-white streaked brown; outer tail feathers extensively dark with small yellow patches.

Siskin. Sexing. Pattern of head: top male; bottom female.

Siskin. Sexing. Pattern of crown: left male; right female.

Siskin. Sexing. Pattern of rump and tail: left male; right female.

### AGEING

It is unlikely to find **juveniles** in Aragon, so only 2 age groups can be recognized:

**1st year autumn/2nd year spring** with moult limit on wing between moulted inner darker greater coverts and outer **juvenile** retained, shorter, paler and with white-yellowish edges; if all greater coverts moulted, then limit is within tertials (**juvenile** with whitish edge, **postjuvenile** with green-yellowish edges), between tertials and secondaries, within alula feathers or between old and fresh primaries and secondaries; if all greater coverts are unmoulted, then limit is between lesser and median coverts; base of inner primaries white-yellowish; unmoulted **juvenile** tail feathers (mainly the outermost) worn and pointed.

**Adult/some postjuveniles with complete moult** without moult limits on wing (**CAUTION:** if moult is suspended, then the retained flight feathers are very worn); greater coverts with greenish edges, except the two outermost which have them whitish; base of inner primaries deep yellow; tail feathers with rounded tips and only one generation.

Siskin. Ageing. Pattern of tips of tail feathers: left adult; right 1st year.

Siskin. Ageing. Moulting limit on wing coverts: top adult; bottom 1st year.

**STATUS IN ARAGON**

Winter visitor. Widely distributed throughout the Region.

Siskin. Adult. Female (12-I).

**MOULT**

Complete **postbreeding** moult, although a few birds may suspend their moult retaining alula and some flight feathers; usually finished in October. Often a partial **postjuvenile** moult involving body feathers, lesser and median coverts, a variable number of inner greater coverts and sometimes all or some alula feathers, all or some tertials and some or all tail feathers (**CAUTION: postjuvenile** moult can be very variable with birds moulting all greater coverts or, on the contrary, others do not moult any greater covert; a few birds may have a complete moult); usually finished in November.

Siskin. 1st year. Male (12-X).
