Red Crossbill. Adult. Male (19-XI).

## RED CROSSBILL (*Loxia curvirostra*)

### IDENTIFICATION

16-17 cm. Strong head and curved bill. **Male** reddish; **female** yellowish green. **Juveniles** greyish with dark streaks.

Red Crossbill. Pattern of bill.

### SIMILAR SPECIES

This species is unmistakable.

### SEXING

**Male** with throat always with red, orange or yellow feathers; upperparts red, pale pink or yellowish-green. **Female** with throat always grey, sometimes speckled dark; upperparts grey-green, with yellowish-green rump. **Juveniles** cannot be sexed using plumage characteristics. **CAUTION:** a few number of **males**, no strictly aged related, have very little orange on body and resemble yellow coloured **females**.

Red Crossbill. Sexing. Pattern of breast: left male; right female.

Red Crossbill. Sexing. Pattern of upperparts: left male; right female.

### AGEING

3 types of age can be recognized:

**Juvenile** greyish coloured, strongly streaked dark; greater coverts fringed whitish; very fresh plumage.

**1st year autumn/2nd year spring** usually with moult limit on wing feathers (if retained, **juvenile** greater coverts have white fringes; in any case primary coverts are usually retained); **2nd year** birds have retained **juvenile** flight feathers very worn.

**Adult/postjuvenile with complete moult** with grey greater coverts, without whitish edges.

**CAUTION:** **juveniles** and **adults** can start their moult in **spring** to be suspended in **summer** and finished in **autumn**, so both types of age can be found with moult limit (but **adult** birds never have feathers with **juvenile** pattern).

Red Crossbill. Ageing. Pattern of breast: left adult female; right juvenile.

Red Crossbill. Ageing. Pattern of upperparts: left adult female; right juvenile.

Red Crossbill. Ageing. Molt limit on wing coverts: top adult; bottom 1st year.

**MOULT**

Complete **postbreeding** moult; most of the specimens moult between August and October, but there are some that start in **spring** and stop the moult to finish it in **autumn**. Partial **postjuvenile** moult, which is very variable, with birds moulting only some body feathers and others moulting all the wing coverts and most of the flight feathers; it's possible to find specimens in active moult during all the year since birds hatched in **winter** start their moult in **spring** and they can suspend it and continue in **autumn**.

Red Crossbill. Ageing. Pattern of tips of greater coverts: left adult; right juvenile.

Red Crossbill. Extent of postjuvenile moult.
