

Bullfinch. Male (15-VII).

### **EURASIAN BULLFINCH** (*Pyrrhula pyrrhula*)

### **IDENTIFICATION**

14-17 cm. Male with black crown and bib; grey upperparts; white rump; dark wings with one white bar; cheek and underparts reddish. Female similar to male but with brownish upperparts and greyish underparts. Juveniles without black crown.

Bullfinch. Pattern of head: top male; bottom female.

#### SIMILAR SPECIES

This species is unmistakable.

**SEXING** 

Male with reddish underparts. Female with brown-grevish underparts. Juveniles cannot be sexed using plumage characteristics.

Bullfinch. Sexing. Pattern of breast: left male; bottom female.

#### AGEING

3 types of age can be recognized:

Juvenile without black crown or bib; very fresh plumage.

1st year autumn/2nd year spring similar to adults but with moult limit on wing between moulted inner greater coverts, darker and with white tips, and the outer juvenile retained, brownish and with buff tips; as they rarely moult the carpal feather, this is nearly always juvenile with buff tip.

Adult with black crown and bib; wing with one age of feathers, without moult limits; carpal feather with white tip.

CAUTION: at any age the three outermost greater coverts are shorter and exhibit narrower fringes than the inner ones and may resemble a moult limit.

Bullfinch. Ageing. Pattern of head: top adult female; bottom juvenile.

Bullfinch. Ageing. Pattern of crown: left adult female; right juvenile.

Bullfinch. Ageing. Pattern of greater coverts: left adult; right juvenile.

### MOULT

Complete **postbreeding** moult, usually finished in October but as later as December. Partial **postjuvenile** moult including body feathers, lesser and median coverts and some greater coverts; some birds can moult all greater coverts, tertials and some inner secondaries; finished between October and December.

Bullfich. Extent of postjuveni le moult.
